MICROSOFT × LSEG HACKATHON 2026

Skew

Where should $100,000 go — and why?

An AI analyst for long-term, asymmetric investing. Every number traced to its source.

mshackathon.vercel.app

Academy Team 1 · Educational project, not financial advice

01 · THE CLIENT

A long-term investor who wants lopsided bets

Fundamentals first. Holds for 5+ years.

Looks for businesses where the realistic upside is far bigger than the realistic downside — and wants to know exactly why each one was chosen.

30%

Index-fund core (VOO) for diversification

70%

6–10 high-conviction individual stocks

12% · 35%

Maximum per stock · per sector

Cares about

Revenue & EPS growth, margins, debt, P/E vs growth, earnings calls, news

Every feature maps to a client goal: lopsided bets → asymmetry ratio · diversification → index core · risk limits → caps · “why?” → cited plain-English memo

01 · THE CLIENT'S PROBLEM

What gets in the client's way — and how Skew helps

Emotional bias

Fear, FOMO and panic selling → rules-based picks and sizing; sell triggers written down in advance

Inflation fears

Idle cash loses value → invests in companies growing earnings faster than prices, on a diversified core

Too much data

Hundred-page filings, endless news → AI reads it all and returns three takeaways plus bull and bear points

Confusion and jargon

P/E, PEG, DCF… → a plain-English memo and one simple bear-vs-bull bar per stock

Who to trust?

Tips, influencers, black-box AI → every claim cited, every number checked

No time to research

Researching alone takes days, so opportunities are missed → 500 stocks screened and 12 filings read in about a minute

02 · THE DATA

Public data, straight from the source

Source	What Skew uses	On the brief's list
SEC EDGAR	5 years of 10-K fundamentals · latest 8-K earnings release · Form 4 insider trades	Yes
Yahoo Finance	Prices · analyst targets · earnings beat record · news	Yes
Nasdaq	Live prices at the moment of recommendation	Our addition

We fixed real-world data problems before trusting it

Stock splits (Booking's P/E read 1.0) · a filing that reported shares in millions · insider tax sales labelled as open-market selling

02 · THE WORKFLOW

From raw data to a client-ready answer

1 · PULL
Sources
SEC EDGAR
Yahoo Finance
Nasdaq (live)

→

2 · COMPUTE
Data engine
Cleans splits and errors; scores 501 stocks; models bear / bull cases

→

3 · INTERPRET
GPT analyst
Reads numbered facts, filings and news; cites every claim

→

4 · DECIDE
Portfolio
Sizes the $100K with client's caps; memo checked against data

→

5 · SHOW
Client app
One click, plain English, charts and sources

Retrieval first, AI second. Every number the AI sees comes from a source — and every claim it makes points back to one.

03 · WHAT THE AI DOES

From 500 companies to one recommendation

01
Screen
Score all 501 stocks 0–100 on growth, quality, debt and value

02
Model
5-year bear, base and bull price for each one

03 · GPT
Read
Reads each finalist's earnings release and news, cites every claim

04
Allocate
Index core plus top picks, sized by score, with caps

05 · GPT
Explain
Writes the client memo; code checks every figure

The AI never produces a number. It reads the facts we retrieve — and cites them.

THE SIGNATURE METRIC

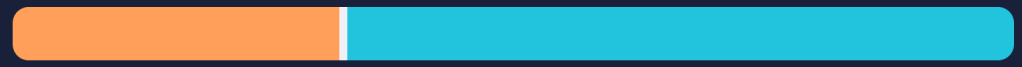

Asymmetry: how lopsided is the bet?

bull upside ÷ bear downside

Both cases project 5 years of earnings growth, then a realistic valuation. The bear case caps growth at 8% a year and shrinks the multiple to 15× earnings.

Only stocks with asymmetry of **1.5× or more** reach the AI.

Example · NVIDIA, 5-year view

Bear -49% Bull +262%

5.3×

The AI still flags the risk: at 43× earnings, the bear case is real.

04 · THE RECOMMENDATION

Where the $100,000 goes

501
S&P 500 stocks

→

462
full data

→

222
asymmetry ≥ 1.5×

→

12
read by GPT

→

8
in the portfolio

30%
VOO index core

8 stocks
≈ 8–12% each, e.g. NVIDIA, Meta, Microsoft, Dexcom

8.1×
weighted asymmetry of the stocks

Why each pick: quality score + asymmetry + the AI's cited conviction → exact dollars and shares. Every near-miss is listed with the reason it was cut.

BUILT FOR A RETAIL INVESTOR

Institutional analysis, one click away

One button

Set the profile with sliders, press Build, watch each step run live

Plain English

A short client memo explains the split, the picks and the risks

Risk at a glance

Allocation donut and a bear-vs-bull bar on every stock

Hover for the source

Every AI claim has a tag that shows the filing text behind it

Verified numbers

Code checks every figure in the AI's memo against the data

Go deeper

Each pick opens a 9-step Stock Research Overview

RECAP · THE JUDGING CRITERIA

How Skew meets each criterion

Criterion	How Skew achieves it
Client focus	Six client problems, each with a specific fix; every feature maps to a client goal
Use of data & AI	GPT reads 12 earnings releases and their news in about a minute, citing every claim
Recommendation	Exact dollars and shares, a bear and bull case per stock, every cut explained
Originality	The asymmetry ratio, hover-to-source citations and an automatically verified memo
Execution	Live on Vercel, a full run in about a minute — demo next

HONEST LIMITS · WHAT'S NEXT

A transparent analyst, not a crystal ball

Limitations today

- Free public APIs: rate limits, delays and gaps (Yahoo was blocked on the venue Wi-Fi)
- Daily data snapshot; only final prices are live
- Past growth is not future growth; scenarios are simple rules
- One client profile; US S&P 500 only

Next

- **Any client, in their own words:** AI turns typed goals into a tailored profile
- Licensed real-time, global data (e.g. LSEG)
- Interest-rate and inflation context from FRED
- **Review checkpoints** (e.g. quarterly): re-run and rebalance, as markets drift from Modern Portfolio Theory's stable assumptions

e.g. "I'm 60, want steady income, and won't invest in oil" → shorter horizon · lower risk · dividend focus · energy excluded
